

Metasurface Displays

How would you collaborate with Collins Aerospace to deploy high resolution, low power, engaging displays for infotainment and passenger systems within an aircraft cabin?

The ability to display dynamic content inside an aircraft is critical, both for passengers as well as the cabin crew. Collins is a world leader in designing, developing and manufacturing cabin interior products, collaborating closely with our customers to provide customized solutions. As display technology continues to advance, we are looking to collaborate with providers utilizing metamaterial, flexible substrate, or other immersive optic approaches for high resolution, direct light displays. Such providers will work with Collins to demonstrate their technology within a representative cabin environment and evaluate their offerings against aerospace environmental requirements.
