

Real-Time Weather Data Fusion

How would you collaborate with Collins Aerospace to support operational decision-making insights from multiple, real-time weather and non-weather data sources?

Rapidly changing weather conditions directly impact the ability of the global transportation system to operate efficiently. Collins provides up-to-the-minute weather information today, leveraging terrestrial and airborne data sources, and continues to innovate on advanced technologies to add further data nodes to the international weather network. As that network continues to expand, we are looking to collaborate with novel data analytics, Insurtech and fleet management technology providers for both aviation and non-aviation applications who are leveraging machine learning or artificial intelligence approaches. Such providers will work with Collins to integrate current and emerging weather and non-weather data sets to develop new predictive tools and test those tools in a lab environment.
